

Treat the following exercises:

1. Write the skeleton of an HTML page. Add the necessary JavaScript code that reverses the content of a textbox when clicking the “Reverse” button. (5 pts)

Reverse text using JavaScript

2. Write an HTML code that divides a page into two frames (See figure below). Write a function that changes the background color of the right frame. (6 pts)

3. Write the skeleton of an HTML page that contains a textbox to enter the Social Security Number composed of 9 digits separated (or not) by 2 dashes, and one “Validate” button. Write a script that tests if the entered number is valid or not. A message box will be displayed if the user clicks “Validate” and the content of the textbox is empty. Another message box will appear if the number is valid.

NB: A valid Social Security Number has the form: xxx-xx-xxxx or xxxxxxxxxx.

(4 pts)

4. Write the skeleton of an HTML page that contains two textboxes t1 and t2, t1 contains the value= “I want to go to t2” and t2 is empty. Write a script that, each second, a character of t1 is added to t2 until all the text in t1 is transferred to t2. (5 pts)
